Summary

Data Management Plans

2 LATEX for typesetting

Data Management Plans

Reproducible Research

Biological Data

Biology has become a data-intensive field. Without a comprehensive plan for collecting, storing, maintaining, and disseminating your data and research products your work will not be reproducible and your contribution will be limited.

Research Products

In addition to data, biology research also yields other products that are necessary for reproducibility and are tools that can advance the field (e.g., software, scripts, databases, tutorials).

Reproducible Research

Biological Data

Biology has become a data-intensive field. Without a comprehensive plan for collecting, storing, maintaining, and disseminating your data and research products your work will not be reproducible and your contribution will be limited.

Research Products

In addition to data, biology research also yields other products that are necessary for reproducibility and are tools that can advance the field (e.g., software, scripts, databases, tutorials).

Planning for Data

Write it Down

A **Data Management Plan** (DMP) is a written plan for dealing with scientific data and all of the products of a research project. This plan accounts for how data (and software, tools, etc.) will be handled during a research project and *after* the project is completed.

Proposing Reproducible Research

White House Mandate

In 2013, a mandate from President Obama required that results of all federally funded research be made publicly available and that these funding agencies develop plans for data management. Data

DMPs are required for funding

NSF, NIH, USDA, NASA, DOE, HHS, CDC, FDA, NIST, NOAA, USAID, AHRQ etc. These and many other funding agencies require data management plans for all proposed research projects and/or awards.

Proposing Reproducible Research

White House Mandate

In 2013, a mandate from President Obama required that results of all federally funded research be made publicly available and that these funding agencies develop plans for data management. Data

DMPs are required for funding

NSF, NIH, USDA, NASA, DOE, HHS, CDC, FDA, NIST, NOAA, USAID, AHRQ etc. These and many other funding agencies require data management plans for all proposed research projects and/or awards.

- data type: genome data, 3D models, CT scans, images, SQL databases, spreadsheets, sequence alignments, field observations, audio/video recordings, etc.
- data format: file type, file size, how metadata will be stored, etc.
- data storage & presentation: keeping data safe (backup) long-term storage and curation
- data sharing: public access of data, sharing agreements, access tophysical collections, privacy issues (like for clinical data), timing of data availability
- publishing dissemination: venues for reporting results, access to published papers (archiving or open access)
- roles & responsibilities which members of the project will carry out components of the DMP

- data type: genome data, 3D models, CT scans, images, SQL databases, spreadsheets, sequence alignments, field observations, audio/video recordings, etc.

Exercise

Take a few minutes to write down the various aspects of data management needed for your research. Consider the following questions:

- What kinds of data are you generating?
- What are the current standards for storing, preserving, and sharing data?
- Are there any potential limitations or restrictions you have to consider when sharing or storing your data?

Description of Data Used and/or Generated

- Describe the types of data, physical samples or collections, software, curriculum materials, and other materials to be produced in the course of the project.
- Describe the standards to be used for all the data types anticipated, including data or file format and metadata.

Accountability

Describe the roles and responsibilities of all parties with respect to the management of the data

- Describe the dissemination methods will be used to make the data and metadata available to others during the period of the award and any modifications or additional technical information regarding data access after the grant ends.
- Describe the PI's policies for data sharing, public access and re-use, including re-distribution by others and the production of degivatizes.

Description of Data Used and/or Generated

- Describe the types of data, physical samples or collections, software, curriculum materials, and other materials to be produced in the course of the project.
- Describe the standards to be used for all the data types anticipated including data or file format and metadata.
- Accountability
 - Describe the roles and responsibilities of all parties with respect to management of the data
 - Describe the dissemination methods will be used to make the date
 - and metadata available to others during the period of the award an any modifications or additional technical information regarding data access after the grant ends.
 - Describe the Pl's policies for data sharing, public access and re-use, including re-distribution by others and the production of decivatizes of

Description of Data Used and/or Generated

- Describe the types of data, physical samples or collections, software, curriculum materials, and other materials to be produced in the course of the project.
- Describe the standards to be used for all the data types anticipated, including data or file format and metadata.

Accountability

 Describe the roles and responsibilities of all parties with respect to the management of the data

ata sharing

and metadata available to others during the period of the award and any modifications or additional technical information regarding data access after the grant ends.

Description of Data Used and/or Generated

- Describe the types of data, physical samples or collections, software, curriculum materials, and other materials to be produced in the course of the project.
- Describe the standards to be used for all the data types anticipated, including data or file format and metadata.

Accountability

Describe the roles and responsibilities of all parties with respect to the contract of the

management of the data

and metadata available to others during the period of the award and any modifications or additional technical information regarding data

Describe the PI's policies for data sharing, public access and re-use,

Description of Data Used and/or Generated

- Describe the types of data, physical samples or collections, software, curriculum materials, and other materials to be produced in the course of the project.
- Describe the standards to be used for all the data types anticipated, including data or file format and metadata.

Accountability

 Describe the roles and responsibilities of all parties with respect to the management of the data

Description of Data Used and/or Generated

- Describe the types of data, physical samples or collections, software, curriculum materials, and other materials to be produced in the course of the project.
- Describe the standards to be used for all the data types anticipated, including data or file format and metadata.

Accountability

 Describe the roles and responsibilities of all parties with respect to the management of the data

- Describe the dissemination methods will be used to make the data and metadata available to others during the period of the award and any modifications or additional technical information regarding data access after the grant ends.
- Describe the PI's policies for data sharing, public access and re-use,
 including to distribution by others and the production of desirent access.

Description of Data Used and/or Generated

- Describe the types of data, physical samples or collections, software, curriculum materials, and other materials to be produced in the course of the project.
- Describe the standards to be used for all the data types anticipated, including data or file format and metadata.

Accountability

 Describe the roles and responsibilities of all parties with respect to the management of the data

- Describe the dissemination methods will be used to make the data and metadata available to others during the period of the award and any modifications or additional technical information regarding data access after the grant ends.
- Describe the PI's policies for data sharing, public access and re-use, including re-distribution by others and the production of derivatives.

Description of Data Used and/or Generated

- Describe the types of data, physical samples or collections, software, curriculum materials, and other materials to be produced in the course of the project.
- Describe the standards to be used for all the data types anticipated, including data or file format and metadata.

Accountability

 Describe the roles and responsibilities of all parties with respect to the management of the data

- Describe the dissemination methods will be used to make the data and metadata available to others during the period of the award and any modifications or additional technical information regarding data access after the grant ends.
- Describe the PI's policies for data sharing, public access and re-use, including re-distribution by others and the production of derivatives.

Description of Data Used and/or Generated

- Describe the types of data, physical samples or collections, software, curriculum materials, and other materials to be produced in the course of the project.
- Describe the standards to be used for all the data types anticipated, including data or file format and metadata.

Accountability

 Describe the roles and responsibilities of all parties with respect to the management of the data

- Describe the dissemination methods will be used to make the data and metadata available to others during the period of the award and any modifications or additional technical information regarding data access after the grant ends.
- Describe the PI's policies for data sharing, public access and re-use, including re-distribution by others and the production of derivatives.

Assignment: Write a DMP

Due: April 5, 2023

Write a DMP based on your research

LATEX for typesetting

LaTeX for typesetting

The intention of this lesson is mainly to give you an introduction to LATEX so that you understand the benefits of using a typesetting system for creating documents.

What is LATEX

Pronunciation

LATEX is pronounced "LAH-tekh" or "LAH-tek" or "LAY-tek" (i.e., don't say the 'x')

TEX

1978 Donald Knuth introduced a typesetting system called TeXthat provides "anyone" the ability to produce high-quality typeset documents (like books).

MTEX

In 1985 Leslie Lamport released LATEX, which is a set of macros for document preparation that uses the TEXtypesetting program and language.

What is MEX

Pronunciation

LATEX is pronounced "LAH-tekh" or "LAH-tek" or "LAY-tek" (i.e., don't say the 'x')

TEX

1978 Donald Knuth introduced a typesetting system called TeXthat provides "anyone" the ability to produce high-quality typeset documents (like books)

PALEX

In 1985 Leslie Lamport released LATEX, which is a set of macros for document preparation that uses the TEXtypesetting program and language.

- It's FREE!
- very flexible and CAN create gorgeous documents
- automation of many tasks like bibliographies and cross-referencing
- major document format changes can be done by changing a single line (or with generally minimal effort)
- based on portable files (plain text) making version control, sharing and collaboration very easy
- beautiful rendering of math and graphics
- excellent online editors
- you can make modular files that compile into a single PDF
- you can comment out sections or include based on conditional statements

- very flexible and CAN create gorgeous documents
- automation of many tasks like bibliographies and cross-referencing
- major document format changes can be done by changing a single line (or with generally minimal effort)
- based on portable files (plain text) making version control, sharing, and collaboration very easy
- beautiful rendering of math and graphic
- excellent online editors
- you can make modular files that compile into a single PDF
- $\hfill\blacksquare$ you can comment out sections or include based on conditional

- Word processing tools like Microsoft Word or Mac OS X Pages or LibreOffice Writer or Google Docs are all excellent tools for creating documents
- editing is intuitive and easy to start right away
- almost everyone has Word installed knows how to use in
- you are required to use it for many documents as an academic

- many are costly
- formatting is often mysterious and challenging to get exactly right
- terrible for equations
- files are difficult to manage using version control, thus collaboration is sometimes clunky (requiring versioned copies of files, tracking changes)
- bibliography management is nearly impossible without second-party software
- figure and other references within a single document are difficult
- default autoformatting
- often not backward/forward compatible

- Substantial learning curve
- it is challenging to collaborate with people who don't know how to use it
- sometimes error messages are cryptic
- it can take some effort to figure out how to do something you've never done before (e.g., create a numbered list that goes in reverse order, which is impossible to do in Word, by the way)
- if your file is very large and contains lots of images (like a long presentation) it can take several seconds to compile
